AUREUS

SCOPE OF WORKS

TERRA ELEMENTIS BUSINESS PLAN

Version 1.1

Updated, February 26, 2026

Terra Elementis represents the integrated enterprise encompassing Terra Elementis, Inc, and its affiliated entities ("Terra") established to develop, operate, and govern the Rare Earth Element portfolio of The Aureus Company. Together, these entities form a unified structure responsible for the design, governance, and expansion of the Terra Elementis ecosystem—including its reserve management, regulatory compliance, and institutional-grade issuance programs.

The Aureus Company is engaged in the structuring and execution of gold reserve-backed instruments, compliant bond issuances, and sovereign-grade liquidity mechanisms that collectively define the Aureus Monetary System. This system integrates verified mineral reserves, bullion holdings, and blockchain-based financial technologies to provide transparent, immutable, and compliant alternatives to fiat-denominated frameworks.

Terra Elementis is being spun out of The Aureus Company to provide a dedicated structure for ownership, production, refining, distribution and government contracts for Rare Earth Elements.

This document contains proprietary business, structural, and financial models exclusively developed by The Aureus Company and its affiliates for the purpose of implementing Terra Elementis and its related instruments. Any dissemination, distribution, or reproduction of this material without express written authorization from The Aureus Company is strictly prohibited. Unauthorized disclosure or misuse may result in liability for damages or other legal remedies.

Artificial Intelligence systems including Chat-GPT, Microsoft Copilot or Alchemy Nexis AI individually, separately or used in a multimodal format, may have been used in the preparation of this document or related materials.

This document, and all discussions or materials relating to The Aureus Company, Terra Elementis, or any affiliated entities, are classified as Confidential Information under applicable confidentiality and non-circumvention provisions. By receiving or retaining this document, the recipient accepts full responsibility to preserve its confidentiality and prevent any unauthorized disclosure, duplication, or distribution.

16. APPENDICES (NON-FINANCIAL) 15

1. EXECUTIVE SUMMARY

Terra Elementis Inc. ("Terra") is a critical minerals platform being formed as a spin-out of rare earth mineral assets and related operations from The Aureus Company. Terra's purpose is to create a public-market scalable, technically defensible mineral platform that can consolidate, certify, and then industrialize strategically relevant rare earth and precious metal reserves with disciplined governance, transparent reporting, and a mine-refine-supply pathway aligned to U.S. strategic supply needs.

Terra's differentiated thesis is that capital markets and government stakeholders increasingly require (i) verified reserves under recognized reporting frameworks, (ii) credible execution partners for mining and refining, and (iii) traceability and chain-of-custody from resource assessment through customer delivery. Terra is designed to meet these requirements through a two-phase strategy: (1) acquire-hold-certify (resource/reserve build first) and (2) mine-refine-supply (fast-track execution after financing), supported by a unified data and evidence platform (MiDAS) that functions as the technical reporting backbone and chain-of-custody "oracle" layer.

1.1. WHAT TERRA ELEMENTIS IS BUILDING

- A public-market platform for critical minerals consolidation, with initial assets located in Arizona and Nevada (already controlled by The Aureus Company).
- A reserve certification and disclosure engine governed by a Qualified Person (Mark Slatten) and producing NI 43-101 and SEC Regulation S-K 1300 aligned outputs.
- A mine-refine-supply execution program run by experienced third-party operators (separate mining operator and refinery operator), with Terra providing capital and mineral portfolio while retaining ownership.
- A government-aligned contracting posture (DOE → DoD → industrial/communications) supported by application-quality documentation and disciplined compliance controls.
- A digital provenance layer implemented after scanning/mapping and QP certification, delivering internal auditability and customer-facing allocation instruments with full chain-of-custody.

1.2. CORPORATE AND CONTROL STRUCTURE

Terra Elementis Inc. (Delaware) is intended to serve as the primary contracting and surviving entity post-transaction. Terra is expected to enter public markets via a Canadian reverse takeover (RTO), followed by a post-closing restructure and reverse split. Following the RTO, restructure/reverse split, and vending-in of rare earth and gold-focused mining claims, The Aureus Company is expected to remain the majority and controlling shareholder and is expected to retain approximately 75% of Terra, subject to final transaction terms and capitalization.

1.2.1. MINERAL ASSET CONTRIBUTION AND VALUATION FRAMEWORK

Terra's US$100B reserve framework is based on an identified pipeline supported by pre-purchase NI 43-101 and SEC S-K 1300 compliant reporting. Post-vend-in updated technical reports will be prepared by the QP to reflect ownership changes and refreshed commodity pricing assumptions. The Aureus Company is expected to receive shares representing approximately US$25B of paid-in capital related to minerals and U.S. dollars retained post production and refining (net of production, refining, and distribution). The remaining approximately US$75B represents unrealized gains attributable to mineral reserves and is expected to be subject to adjustment and offset based on true production costs and actual outcomes.

This framework is directional and should not be construed as a guaranteed realizable value or an audited financial measure; it is subject to commodity price volatility, recovery rates, engineering assumptions, permitting and development timelines, and true costs.

1.3. FINANCING AND CAPITAL STRATEGY

- Initial capital formation via Regulation D, Rule 506(c) convertible notes (terms addressed in the separate offering package).
- Transition to development capital through an integrated DOE financing lane (~US$750m) and/or a project-level securitized note offering secured by a security interest over minerals.
- DOE structure concept: interest during construction (IDC) capitalized; cash debt service commences in Year 5; 10% gross revenue sweep applied from Year 5 to service interest and repay principal (10-year term outer bound; objective to repay within ~5 years of production, subject to ramp and pricing).
- Public company capital strategy: use equity issuance for M&A expansion and consolidation once the public platform is stabilized and reporting discipline is established.

1.4. TECHNOLOGY AND DATA GOVERNANCE

MiDAS, provided by Alchemy Nexis under a Master Services Agreement, functions as Terra's mineral data and reporting backbone. MiDAS integrates Alchemy EcoMiners and third-party geophysics/drone/satellite/LiDAR inputs, supports evidence assembly for NI 43-101 and S-K 1300 technical reporting, and provides the data/oracle layer for in-ground tokenized mineral assets and end-to-end chain-of-custody (implemented after scanning/mapping and QP certification).

1.5. IMPLEMENTATION ROADMAP (TOP-LINE)

Phase	Objective	Key Outputs
Phase I (0–18 months)	Public-market entry + certify-first buildout	RTO close; restructure/reverse split; MiDAS go-live; post-vend-in NI 43-101/S-K 1300 updates; operator partner shortlist; DOE application pack.
Phase II (18–60 months)	Industrialization + mine-refine-supply	DOE close and construction; IDC capitalization; ramp to production; refinery commissioning; tokenization/provenance roll-out; revenue sweep begins Year 5.
Phase III (5–50 years)	Long-life production + expansion	Sustained operations; expansion to new jurisdictions; portfolio consolidation; ongoing technical updates; supply assurance performance.

1.6. THE AUREUS COMPANY — STRATEGIC PROFILE)

The Aureus Company is a consolidated group delivering reserve-backed capital solutions and sovereign-aligned monetary infrastructure anchored in certified gold reserves and related strategic minerals. Its mandate is to build a consistent and dependable supply of gold drawn from certified reserves across In-Ground (IG), In-Production (IP), and In-Vault (IV) categories, and to deploy these reserves as collateral for structured financing, securitized instruments, and regulated digital settlement mechanisms. The Aureus Company's integrated framework includes reserve-backed funding programs, securitization of certified mineral reserves, issuance of gold-backed institutional bonds and Gold Linked Notes, and a global monetary system anchored in physical gold under audit and trustee oversight.

1.6.1. VISION, MISSION, AND OPERATING PRINCIPLES

Vision: to deliver a modern, gold-anchored financial architecture ("The New Gold Standard") providing immutable monetary infrastructure, system integrity, and transparency for sovereigns, institutions, and markets. Mission: to unify minerals, bonds, banking, and digital platforms into one integrated and compliant framework,

including gold-backed credit facilities, institutional reserve banking, regulated products, compliant bond programs, cross-border settlement mechanisms, and independently audited custody solutions, ensuring every instrument is measurable and grounded in verifiable certified reserves.

1.6.2. CORE PLATFORMS AND CAPABILITIES

The Aureus Company's platform is organized around interlocking pillars:

- The Aureus Mineral Funding Solution: a reserve-backed lending and capital framework using patented and unpatented mining claims and certified mineral reserves as collateral to provide secured credit facilities and structured capital to mining and exploration companies. The framework is engineered to deliver competitive terms, institutional governance, and collateral integrity while enabling operators to maintain liquidity by leveraging in-ground and in-production assets.
- Asset Backing and Collateralization Framework: an institutional-grade collateral model built on IG reserves (certified reserves within mining claims), IP reserves (approved mine plans and scheduled production), and IV reserves (refined and vaulted 999.9 gold bullion and serialized Aureus Coins). Collateralization is designed around bankruptcy-remote structures, trustee control, perfected security interests, and defined collateral pools, with disciplined over-collateralization requirements (e.g., 120% minimum coverage at issuance) and quarterly revaluation and collateral checks.
- Proof-of-Reserve (PoR) and Audit: an evidence and reporting program integrating technical reporting for IG reserves, serialized bullion inspection for IV reserves, MiDAS/MiDAS-Sky datasets, Qualified Person certifications, and trustee/custodian verification to produce quarterly PoR reporting and event-driven audits.
- The Aureus Monetary System: a reserve-backed monetary architecture that combines physical reserves with regulated digital issuance and settlement mechanisms. The system includes ATX (a fully reserved gold stablecoin representing one troy ounce of 999.9 fine vaulted gold) and The Aureus Coin (a serialized 1-oz 999.9 fine gold coin held in custody and digitally mirrored as an ERC-721 instrument), supported by ongoing PoR procedures and regulated issuance controls.
- Aureus Money and Merchant Solutions: a gold-backed account platform and payments layer intended to provide institutional and accredited clients with access to gold-backed accounts, settlement rails, and merchant tooling, subject to licensing and regulatory approvals.

1.6.3. CORPORATE STRUCTURE (HIGH-LEVEL)

For purposes of group structure, "The Aureus Company" refers collectively to the ecosystem of companies operating under a parent hierarchy consisting of: The Aureus Company Pte Ltd (ultimate global holding company and intellectual property owner), Aureus International Limited (Ireland; international holding), and Aureus Holdings (US) LLC (domestic parent for U.S. operating subsidiaries). Operating subsidiaries and SPVs perform defined roles across funding/client interface, minerals acquisition/sales/streaming, services and oversight, reserve holding entities for bond/token programs, and digital issuance entities.

1.6.4. RELEVANCE TO TERRA ELEMENTIS

Terra is being formed as the public-market vehicle and operating platform for the rare earth minerals and related operations spun out from The Aureus Company. In the Terra program, The Aureus Company is the originating asset platform controlling the initial Arizona and Nevada claims, managing in-ground allocated gold reserve programs, and expected to remain the controlling shareholder post-transaction. Terra leverages The Aureus Company's reserve governance discipline, technical reporting architecture, and collateralization mindset while extending the platform to a mine-refine-supply execution pathway for rare earth elements and precious metals aligned to U.S. strategic supply priorities.

2. COMPANY OVERVIEW

Terra is structured to be legible to both public-market investors and government stakeholders. As a public-market platform, Terra is designed to acquire and consolidate strategic mineral assets and provide the disclosure discipline necessary to sustain investor confidence and exchange readiness. As a supply platform, Terra is designed to progress from certified reserves to production and refining capacity through operator partnerships and government-aligned financing pathways.

2.1. CORPORATE STRUCTURE AND PUBLIC-MARKET PATHWAY

- Primary entity: Terra Elementis Inc. (Delaware) — contracting and surviving entity.
- Public listing pathway: Canadian RTO → post-closing restructure/reverse split → NASDAQ readiness gate (12–18 months).
- Confidential RTO details (shell identity, exchange/ticker, reverse split ratio, pro forma capitalization) to be disclosed via PPM Supplement upon execution of definitive agreement.

2.2. GOVERNANCE FRAMEWORK

Terra's governance is designed for public-market credibility and institutional diligence: a five-member Board comprised of three independent directors and two company nominees. The company nominees are expected to be Peter Banks (CEO) and David Roland Crouch II (CIO & Interim CFO). Independent directors are under confidential negotiation and will be selected to bring domain credibility across defense, government, critical minerals, manufacturing supply chains, and mine operations.

2.3. LEADERSHIP

Terra's operating leadership combines public-market readiness, government-facing engagement capability, and systems-driven governance. The CEO and interim finance/systems leadership will drive disciplined execution during the certification and platform buildout phases, while operator partners provide deep execution capacity for mining and refining.

3. MARKET OPPORTUNITY

The strategic rationale for Terra is grounded in the convergence of three forces: (1) structural demand growth for critical minerals, (2) government supply chain resilience priorities and procurement pathways, and (3) capital markets demand for disciplined disclosure and scalable consolidation platforms. Terra is positioned at the intersection of these forces.

3.1. DEMAND DRIVERS

- Defense and national security systems requiring specialty materials and resilient supply chains.
- Electrification and advanced manufacturing demands increasing pressure on upstream and midstream capacity.
- Communications and high-technology manufacturing requiring dependable material quality and traceability.
- Strategic stockpiling and procurement programs increasing emphasis on domestic and allied sourcing.

3.2. STAKEHOLDER MAP

Stakeholder	Interest	What Terra Provides
DOE	Domestic supply + financing programs	Mine-refine-supply pipeline; compliance pack; repayment sweep policy; long-term supply discipline.
DoD / Contractors	Secure supply + specifications	Verified reserves; contracted supply waterfall; chain-of-custody assurance.
Manufacturers	Quality + continuity + provenance	Allocation instruments; consistent reporting; predictable delivery pathways.
Investors	Disclosure + scalability + governance	NI 43-101/S-K 1300 discipline; public platform; operator model; governance.

4. BUSINESS MODEL

Terra's model intentionally separates (i) asset ownership and governance from (ii) operational execution. Terra retains ownership and provides capital, portfolio management, and disclosure discipline, while experienced operators run mining and refining. This structure reduces execution risk, increases lender confidence, and supports scalable expansion.

4.1. PHASE I: ACQUIRE, HOLD, AND CERTIFY

In Phase I, Terra's primary objective is to establish technical defensibility and public-market credibility. This phase includes asset onboarding, technical verification, and reporting discipline anchored to QP governance. It also includes MiDAS integration and evidence management to support institutional diligence and government-facing review.

- Portfolio onboarding: transfer/vend-in of claims into Terra; confirm chain-of-title and enforceability of mineral rights.
- Data consolidation: ingest historical datasets and integrate new data acquisition programs (scanning/mapping, geophysics, drone/satellite/LiDAR).
- QP review and estimation: resource/reserve classification, modifying factors, and sign-off processes under NI 43-101 and S-K 1300.
- Disclosure readiness: build a repeatable disclosure process and internal controls for technical and market communications.
- Operator pathway design: identify and pre-qualify mining and refinery operators; outline contract terms and KPIs (non-financial).

4.2. PHASE II: MINE-REFINE-SUPPLY (OPERATOR-RUN EXECUTION)

Phase II is activated after financing (DOE and/or project-level secured notes) and feasibility confirmation. Operations are conducted by experienced operators under contracts that preserve Terra's ownership position and enforce reporting, safety, throughput, and quality requirements.

- Mining execution: operator-led mine planning, permitting support, production ramp-up, and HSE compliance, with Terra oversight via governance and reporting.
- Refinery execution: separate experienced refinery operator responsible for processing throughput, quality assurance, and compliance, integrated into Terra's chain-of-custody.

- Economics: 50/50 split with operators (structured via project agreements; details deferred to financial model).
- Supply program: prioritize DOE-aligned channels, then DoD, then commercial industrial and communications buyers.

5. OPERATING PLAN

5.1. INITIAL FOOTPRINT: ARIZONA AND NEVADA

Initial claims in Arizona and Nevada are already controlled by The Aureus Company and are expected to be vended into Terra. The plan assumes immediate initiation of data acquisition and QP governance workstreams upon transaction readiness, with emphasis on reserve defensibility and disclosure discipline.

5.2. EXPANSION PROGRAM

After stabilizing the public platform and completing initial certification workstreams, Terra will expand into additional U.S. states, Canada, and Australia, and selectively into jurisdictions across Africa, Asia, the Americas, and Europe. Expansion is gated by the availability of defensible data, enforceable mineral rights, regulatory and geopolitical risk profiles, and the ability to integrate assets into Terra's evidence and reporting system.

5.3. OPERATOR PARTNER SELECTION CRITERIA

- Demonstrated operating history in similar deposit types and regulatory environments.
- Strong safety and environmental compliance record; capability to satisfy government and lender diligence requirements.
- Ability to operate under transparent reporting and KPI frameworks; willingness to integrate operational data into MiDAS.
- Proven commissioning and ramp-up capability; throughput track record for refinery operator.

6. TECHNICAL REPORTING AND COMPLIANCE PROGRAM

6.1. REPORTING FRAMEWORKS AND USE

Terra's reporting program is explicitly oriented toward Canadian and U.S. listing and disclosure requirements. NI 43-101 and SEC Regulation S-K 1300 reporting outputs are used both for public-market disclosure readiness and for lender/government diligence. JORC reporting is not committed for this program because it is not an initial listing requirement in the targeted pathway.

6.2. QUALIFIED PERSON GOVERNANCE (MARK SLATTEN)

Mark Slatten serves as the Chief Geologist of Alchemy EcoMiners and acts as Terra's Qualified Person. In this capacity, he provides oversight of exploration, data acquisition, mineral systems analysis, resource and reserve estimation, and sign-off of technical reports under NI 43-101 and SEC S-K 1300 as applicable. QP governance is central to Terra's credibility and is integrated into every step of the certification and disclosure process.

6.3. EVIDENCE MANAGEMENT AND DISCLOSURE CONTROLS

- Standardized data lineage: source identification, timestamped ingestion, and integrity checks.
- Document control: versioning for technical reports, exhibits, assumptions, and price decks used in reporting.
- Auditability: internal logs suitable for audit firm review and lender/government review processes.

- Disclosure cadence: controlled release process aligned to public market obligations and supplement mechanisms (PPM supplements for offering disclosures; later public filings as required).

7. TECHNOLOGY ENABLEMENT: MIDAS AND THE ORACLE LAYER

MiDAS is Terra's core technical reporting and operational control platform. It integrates multiple sources of technical data and converts them into defensible reporting outputs and operational audit trails. MiDAS is delivered as a SaaS platform by Alchemy Nexis and integrates Alchemy EcoMiners and third-party geophysics/drone/satellite/LiDAR providers.

7.1. KEY MIDAS FUNCTIONS IN THE TERRA PROGRAM

- Reserve and resource workflow management: data ingestion, model iteration, classification, and sign-off workflows.
- Reporting assembly: creation of NI 43-101 and S-K 1300 evidence packs and annexable technical outputs.
- Operational telemetry and custody events: recording production, refining, inventory movements, custody transitions, and delivery events.
- Tokenization enablement: data/oracle system for in-ground tokenized mineral assets and customer-facing allocation instruments, implemented after scanning/mapping and QP certification.

8. TOKENIZATION AND CHAIN-OF-CUSTODY

Terra's tokenization and chain-of-custody capability is designed as a disciplined, evidence-anchored system to support internal controls, customer provenance, and allocation instruments. Implementation is staged to occur after ground scanning, 3D spatial mapping, and QP certification are completed, ensuring the digital layer is anchored to defensible technical evidence.

8.1. INTERNAL CONTROLS AND CUSTOMER ALLOCATION

- Internal audit trail: immutable record of assessments, QP certifications, production lots, refining batches, custody transitions, and delivery checkpoints.
- Customer provenance: standardized certificates and digital attestations supporting origin and processing pathway.
- Customer-facing allocation instruments: assigned lots linked to MiDAS evidence and custody records for allocation, settlement coordination, and delivery confidence.

9. GO-TO-MARKET AND CONTRACTING STRATEGY

9.1. SUPPLY WATERFALL

Terra's contracting posture prioritizes supply as follows: DOE → DoD → industrial/communications customers.

9.2. CONTRACTING INSTRUMENTS

- Framework agreements for long-term supply intent and technical specifications.
- Purchase orders (POs) and staged delivery commitments aligned to ramp-up and throughput.
- Quality assurance and acceptance protocols suitable for defense and industrial buyers.
- Chain-of-custody deliverables integrated into contracting to increase stakeholder confidence.

10. DOE INTEGRATED FINANCING LANE

Terra's DOE lane is structured as an integrated mine-refine-supply program with indicative scale of approximately US$750 million. The program is supported by an application-ready documentation plan and a conservative repayment posture intended to reduce lender risk and demonstrate disciplined governance.

10.1. CONSTRUCTION PERIOD: INTEREST DURING CONSTRUCTION (IDC)

During construction, interest is expected to be capitalized as interest during construction (IDC), meaning interest accrues from the date of each draw and is added to the loan balance rather than being paid in cash during the construction phase. Cash debt service is expected to commence in Year 5.

10.2. REPAYMENT POLICY AND TENOR

Beginning in Year 5, Terra intends to apply approximately 10% of gross revenue to debt service (interest and principal). The DOE facility is expected to have a 10-year contractual repayment term as an outer bound, while Terra's base-case objective is repayment within approximately five years of production, subject to ramp-up timing, commodity pricing, operating performance, and actual throughput.

11. PROJECT-LEVEL SECURITIZED NOTES (ALTERNATIVE / COMPLEMENT)

Terra contemplates project-level secured notes as an alternative or complement to DOE financing. These instruments are intended to be secured by a security interest over minerals and aligned to specific project outputs, offtake arrangements, and contractual controls.

11.1. SECURITY AND GOVERNANCE CONCEPTS (NON-FINANCIAL)

- Security interest over minerals and/or mineral proceeds, subject to jurisdictional law and perfection requirements.
- Covenants tied to operational reporting, custody controls, and offtake performance.
- Use of MiDAS data and chain-of-custody records as supporting evidence for covenant monitoring.

12. PUBLIC MARKETS STRATEGY

12.1. CANADIAN RTO AND RESTRUCTURE

Terra expects to enter public markets via a Canadian RTO, followed by restructure and reverse split. Counterparty identity, listing details, reverse split ratio, and pro forma capitalization will be disclosed via PPM Supplement upon execution of a definitive agreement.

12.2. NASDAQ READINESS GATE (12–18 MONTHS)

- Technical reporting maturity: updated NI 43-101 and S-K 1300 annexes supporting reserve narrative.
- Governance maturity: appointment of three independent directors with relevant sector backgrounds.
- Operational readiness: operator partnership agreements and DOE application readiness pack.
- Disclosure discipline: consistent investor communications supported by OrionIQ; audit readiness program underway.

13. GOVERNANCE, LEADERSHIP, AND KEY COUNTERPARTIES

13.1. BOARD AND MANAGEMENT

Terra's board is structured as five directors: three independent (to be appointed) and two company nominees (Peter Banks; David Roland Crouch II). The Company is in confidential negotiations with high-profile independent board candidates spanning defense, former government officials, critical minerals experts, manufacturing supply chains, and mine operations.

13.2. LEGAL, AUDIT, AND IR/PR

- Legal counsel: Husch Blackwell LLP (primary relationship partner: Brian H. Potts) providing transactional, regulatory, operational risk management, and offering oversight; coordinating specialist firms as needed.
- Audit firm: to be appointed; multiple firms including several commonly regarded as "Big 5" under review; final selection disclosed via supplement.
- Investor relations/public relations: OrionIQ International Limited supporting investor communications and public-market readiness messaging (non-broker activities).

13.3. 13.3 KEY PERSONNEL BIOS

13.3.1. PETER BANKS — CHIEF EXECUTIVE OFFICER

Peter Banks is a senior executive with more than three decades of experience in large-scale infrastructure investment, regulated industries, and cross-border commercial negotiation. His career spans senior leadership and advisory roles across the United Kingdom, the United States, Europe, and Asia, with sector experience including mining and natural resources, manufacturing, transportation, and strategic infrastructure development.

Mr. Banks has led and participated in complex, high-value initiatives in both commercial and government-adjacent environments. He served as co-lead in negotiations that concluded the Karen Nation conflict in Myanmar, an outcome that facilitated subsequent foreign investment in cement production, rare earth mining, and gem exploration. He also led negotiations in Laos relating to investment in the Sepon region, which hosts one of the world's largest gold deposits.

Earlier in his career, Mr. Banks was recruited to lead business development activities for Monster Cable in the EMEA region, where he was involved in the development and market introduction of THX and Beats, the latter of which was later acquired by Apple Inc. He subsequently acted as a consultant to British Airways, designing and implementing a customer relations program that materially reshaped the airline's customer engagement framework.

An entrepreneur by background, Mr. Banks founded Bpan Muue and completed a successful exit prior to the COVID-19 pandemic. He also serves as a Non-Executive Director of Explore My Store (EMS), a large online marketplace in the Pacific region, where he provided strategic oversight during a period that included a multi-million-dollar investment from Microsoft.

Mr. Banks' professional focus is on disciplined execution, operational efficiency, and long-term value creation. His experience across regulated, cross-cultural, and capital-intensive environments informs his approach to governance, risk management, and strategic growth initiatives.

13.3.2. DAVID ROLAND CROUCH II — CHIEF INFORMATION OFFICER & INTERIM CHIEF FINANCIAL OFFICER

David Roland Crouch II serves as Terra Elementis' Chief Investment Officer and Interim Chief Financial Officer, bringing a combined skill set spanning capital strategy, policy and regulatory interface, and systems-driven oversight. He is a finance executive, policy strategist, and government affairs advisor with cross-disciplinary experience across financial strategy, regulatory engagement, digital systems, and institutional governance, with advisory exposure across North America, Eastern Europe, the Balkans, Southern Europe, Africa, and the Pacific.

In his interim finance capacity, Mr. Crouch supports disciplined financial stewardship during Terra's capital formation and public-market transition phase. His responsibilities include establishing and supervising interim financial reporting frameworks, budgeting discipline, and capital controls; aligning management reporting with investor and regulatory expectations; and coordinating between finance, legal, and executive leadership to support capital raising, compliance readiness, and governance transparency. He also supports the Board and senior management during transitional and formative phases of Terra's financial architecture.

As Chief Investment Officer, Mr. Crouch is responsible for investment strategy oversight and capital allocation support across Terra's certify-first and industrialization phases. This includes supporting disciplined evaluation of mineral asset opportunities and project pathways, maintaining capital integrity standards across investment decisions, and ensuring that investment narratives remain consistent with disclosure discipline and stakeholder confidence requirements appropriate for accredited investors and future public-market readiness.

Mr. Crouch's background includes serving as Director of Government Affairs – Americas for Aureus / Alchemy Nexis affiliated entities, where he advises U.S. congressional, executive branch, and defence stakeholders on supply chain resilience, tax policy, and strategic resource governance. In that role, he engages with U.S. agencies including the Departments of Defense, Treasury, State, and Commerce on matters relevant to minerals, national security, and regulatory alignment, and supports cross-border policy engagement across the United States, the MENA region, and Canada.

He also serves as Chief Executive Officer & Chief Investment Officer of Decorus Imperium, a global financial literacy and investment education organisation active in 36 countries, where he oversees investment strategy, organisational governance, and investor-facing communications. Across these roles, Mr. Crouch's professional focus is on capital integrity, reporting discipline, and stakeholder confidence—capabilities Terra leverages as it builds a credible certified reserve base and advances toward mine-refine-supply execution and public-market maturity.

13.3.3. MARK SLATTEN — CHIEF GEOLOGIST (ALCHEMY ECOMINERS) AND QUALIFIED PERSON

Mark Slatten is the Chief Geologist of Alchemy EcoMiners and Qualified Person. In this capacity, he provides oversight of geological exploration, data acquisition, and mineral systems analysis; supervision of Mineral Resource and Mineral Reserve estimation activities; and review, validation, and sign-off of technical reports prepared under NI 43-101 and SEC Regulation S-K 1300 frameworks, as applicable. He integrates traditional geological workflows with advanced analytical and data-driven systems, including the MiDAS™ mineral analysis platform, and provides technical input into project evaluation, development planning, and investment due diligence.

Mr. Slatten is also Chief Executive Officer & Qualified Person of Maverick Eco-Miners, Inc. He has participated in every phase of mineral asset development, including exploration, modelling, drilling oversight, assay interpretation, and technical reporting. He has produced, reviewed, or signed off on more than 150 mineral resource and mineral reserve reports during his career as a Qualified Person and has read and interpreted thousands of resource/reserve estimates and mine evaluation technical reports, contributing to over US$30 billion in investment funding decision contexts.

Education & credentials include an M.S. in Geology (minor in Geophysics) from the University of California (UCLA / UC Riverside), Qualified Person standing (as stated), multi-jurisdictional U.S. registrations/licensing (as stated), and PhD studies in risk assessment of open pit mining (pending completion).

14. RISK MANAGEMENT FRAMEWORK

Terra's risk management framework is built around staged execution and evidence-based decision-making. The certify-first strategy reduces technical and disclosure risk before major development capital is deployed. The operator model reduces execution risk by assigning operational performance to experienced teams while retaining Terra ownership and governance control.

14.1. CORE RISK CATEGORIES AND MITIGATIONS

Risk Category	Key Risks	Mitigations
Technical	Reserve misclassification; data integrity; disclosure errors	QP governance; standardized workflows; MiDAS evidence management; third-party data validation.
Execution	Permitting delays; ramp-up underperformance; cost blowouts	Experienced operators; contractual KPIs; phased financing; conservative scheduling.
Market	Commodity price volatility; demand shifts	Diversified basket (REE + gold + silver); multi-channel offtake strategy; disciplined hedging policy (financial model).
Financing	DOE approval/timing; capital market windows	Dual pathways (DOE + secured notes); documentation readiness; staged milestones.
Governance	Controlling shareholder alignment; public-market compliance	Independent directors (3/5); disclosure controls; audit readiness; transparent governance policies.

15. IMPLEMENTATION ROADMAP

15.1. WORKSTREAM BREAKDOWN

- Workstream A — Public-market transaction: RTO execution, restructure, reverse split planning, disclosure controls.
- Workstream B — Technical certification: scanning/mapping, data acquisition, QP workflows, NI 43-101/S-K 1300 updates.
- Workstream C — Operator onboarding: mining operator selection, refinery operator selection, KPI framework, governance reporting.
- Workstream D — DOE readiness: application pack, compliance and environmental workstreams, contracting/offtake readiness.
- Workstream E — Chain-of-custody: MiDAS lifecycle tracking, custody event logging, tokenization readiness after evidence completion.
- Workstream F — Communications: IR/PR cadence with OrionIQ, stakeholder engagement materials, public-market readiness messaging.

15.2. 90-DAY PLAN

- Lock technical workplan: define scanning/mapping scope, vendor selection process, and MiDAS integration specifications.
- Build evidence pack architecture: define data lineage standards, version controls, and QP sign-off checkpoints.

- Start operator selection: produce criteria, shortlist, diligence questions, and draft high-level terms for 50/50 operator model.
- DOE readiness scope: define documentation checklist, timeline, responsible owners, and external adviser engagement plan.
- IR/PR cadence: define message map, stakeholder channels, update frequency, and disclosure controls integration.

15.3. 12-MONTH PLAN

- Complete initial post-vend-in NI 43-101/S-K 1300 update cycle for core assets; annex to supplemental disclosures as appropriate.
- Complete scanning/mapping on initial assets; integrate third-party datasets into MiDAS; finalize tokenization readiness plan.
- Negotiate and sign operator agreements (mining + refinery) with reporting and chain-of-custody obligations.
- Advance DOE application submission readiness; complete permitting and environmental workstream mapping.
- Strengthen audit readiness and public-market compliance workflows; finalize audit firm selection and onboarding.

15.4. 18-MONTH NASDAQ READINESS GATE

- Governance maturity: appoint three independent directors.
- Reporting maturity: maintain consistent technical disclosure controls and updated technical annexes.
- Operational readiness: operator program and DOE readiness pack demonstrably advanced.
- Communications maturity: consistent investor communications and public-market compliance discipline.

16. APPENDICES (NON-FINANCIAL)

- Appendix A — Glossary (REEs, QP, NI 43-101, SEC S-K 1300, IDC, offtake, etc.)
- Appendix B — Technical Reporting Framework Summary (NI 43-101 and S-K 1300)
- Appendix C — MiDAS Lifecycle: Assessment → Certification → Mining → Refining → Distribution → Customer Handover
- Appendix D — Governance Summary (Board composition; independent director target profiles; disclosure controls)
- Appendix E — Stakeholder Engagement Summary (DOE/DoD/manufacturers/investors)

17. APPENDIX A — GLOSSARY

Term	Definition
Aureus Company / The Aureus Company	The originating asset and reserve-governance platform from which Terra is spun out; expected controlling shareholder.
ATX	Gold-linked token concept within The Aureus Company ecosystem (one troy ounce equivalent of vaulted 999.9 fine gold), subject to reserve and audit controls.
Beneficial Ownership Caps	Conversion limits: 10% per holder and 25% aggregate across all noteholders under the Offering, measured on basic issued-and-outstanding shares.
Chain of Custody	End-to-end record of material movement and custody transitions from assessment through delivery.
Closing Price	Market closing price used for conversion pricing (official close; if none, last trade; if no trade, most recent prior trading day close).
DOE	United States Department of Energy.
DoD	United States Department of Defense.
IDC (Interest During Construction)	Interest accrued during construction and capitalized into loan principal rather than paid in cash during construction.
In-Ground (IG) Reserves	Certified mineral reserves associated with mining claims prior to extraction, subject to technical reporting and governance.
In-Production (IP) Reserves	Reserves associated with approved mine plans and scheduled production (development/operating state).
In-Vault (IV) Reserves	Refined and vaulted bullion reserves under custody controls and audit/PoR processes.
MiDAS	Mineral Information Data Analysis System: SaaS platform provided by Alchemy Nexis for data ingestion, technical reporting workflows, and lifecycle chain-of-custody/oracle functions.
NI 43-101	Canadian standard for disclosure of scientific and technical information about mineral projects.
SEC Regulation S-K 1300	U.S. mining property disclosure standard for registrants, including resource/reserve reporting.
Offering	Terra's Regulation D, Rule 506(c) offering of 12% convertible promissory notes (separate offering package).
PPM Supplement	Formal written supplement that updates the offering disclosure; used for confidential RTO counterparty identity, reverse split ratio, and pro forma capitalization schedules.
Qualified Person (QP)	Technical professional responsible for oversight/sign-off of resource/reserve estimates and technical reporting under NI 43-101/S-K 1300.
REEs	Rare earth elements; Terra emphasizes a broad REE basket.

RTO (Reverse Takeover)	Public market transaction in which Terra becomes the operating business of a listed Canadian issuer.
Tokenization / Allocation Instrument	Digital representation of an allocated interest in production lots/batches anchored to chain-of-custody evidence; implemented after scanning/mapping and QP certification.

18. APPENDIX B — TECHNICAL REPORTING FRAMEWORK SUMMARY (NI 43-101 AND SEC S-K 1300)

Terra's disclosure discipline is oriented toward Canadian and U.S. listing pathways. Technical reporting outputs are expected to be prepared and/or supervised by the Qualified Person and used for both public-market disclosure readiness and lender/government diligence.

18.1. NI 43-101 TECHNICAL REPORTING (CANADA)

1) What NI 43-101 is designed to do

NI 43-101 is the Canadian disclosure regime governing **scientific and technical information about mineral projects** that is disclosed by (or on behalf of) Canadian reporting issuers. Its central policy objective is to ensure that public disclosures about mineral projects are **reliable, comparable, and grounded in technical work** performed or supervised by a **Qualified Person (QP)**. In practice, NI 43-101 acts as a "truth-enforcement layer" between mineral project marketing narratives and investor-grade technical disclosure.

2) When NI 43-101 applies (in practical terms)

NI 43-101 is triggered when a reporting issuer discloses information such as:

- mineral resources and/or mineral reserves,
- exploration results (including drilling and sampling),
- metallurgical recoveries, process routes, or key technical parameters,
- project economics that are materially dependent on mineral resources/reserves (particularly in PEA/PFS/FS contexts), or
- other material scientific or technical information about a project.

Even where the issuer is not yet fully reporting, NI 43-101 principles are routinely required by counterparties (banks, strategic buyers, sophisticated investors) as the **baseline standard** for "financeable" disclosure quality in the Canadian ecosystem.

3) The Qualified Person (QP) role under NI 43-101

A QP is central. NI 43-101 requires that a QP:

- has the right technical qualifications and relevant experience,
- takes responsibility for the technical content being disclosed, and
- supports the disclosures with appropriate work, data, and documentation.

For Terra, the QP function is provided by **Mark Slatten (Chief Geologist, Alchemy EcoMiners; Terra Qualified Person)**, with the program structured so that the QP has clear authority over:

- sampling methodologies and chain-of-custody for samples and assays,
- estimation methods and classification choices,
- disclosure assumptions and limitations,
- the technical basis for any resource/reserve statements, and
- the technical sections of any forward-looking technical statements.

4) Technical report types and the "maturity ladder"

NI 43-101 reporting commonly progresses through stages, often described as a maturity ladder:

- **Exploration Results Disclosure**

Focus: data integrity, QA/QC, sampling, and transparent presentation of results.

- **Mineral Resource Estimate (MRE)**

Focus: geological model, estimation methods, classification (Inferred/Indicated/Measured), and constraints.

- **Preliminary Economic Assessment (PEA)**

Focus: high-level economics and development concept. Important caveat: a PEA can include a meaningful portion of Inferred resources, which increases uncertainty.

- **Pre-Feasibility Study (PFS)**

Focus: improved engineering definition and economic confidence; typically more stringent reliance on Indicated/Measured resources.

- **Feasibility Study (FS)**

Focus: highest engineering definition used for financing-grade decisions; supports reserve conversion and project financing.

Terra's plan should treat NI 43-101 work as **a continuous disclosure control system**, not a one-off report: pre-purchase technical reporting exists for the pipeline, then **post-vend-in updates** are completed to reflect ownership changes, refreshed price assumptions, and new data acquisition (ground scanning + 3D mapping + integrated geophysics).

5) What investors and regulators expect to see in NI 43-101 work products

While NI 43-101 has formal technical report requirements, the practical evidence stack typically includes:

- **Project description**: location, tenure, mineral rights, and a defensible basis for ownership/control.
- **Geology and mineralization model**: deposit type, structural controls, mineral system logic.
- **Exploration data**: drilling, sampling, assays, QA/QC protocol, chain-of-custody, lab certifications.
- **Data verification**: what was verified, how, and by whom (QP responsibilities).
- **Resource estimation**: methodology, assumptions, interpolation techniques, cut-offs, constraints, classification rationale.
- **Metallurgy and processing** (where relevant): process route assumptions, recoveries, testwork, and limitations.
- **Infrastructure and development constraints**: access, power, water, permitting, and other key constraints.
- **Risks and uncertainties**: technical risks, data gaps, and key sensitivities.

6) How Terra uses NI 43-101 in the business plan

Terra uses NI 43-101 as a **public-market and institutional diligence credential** in three ways:

1. **Reserve defensibility**: treat NI 43-101 standards as the minimum bar for credible reporting.
2. **Capital formation enablement**: provide reports as annexes to the Supplemental PPM / PPM Supplements and later as public disclosures as required.
3. **Financing readiness**: support DOE and secured-note diligence with transparent, QP-governed reporting and evidence packs.

7) Terra-specific annex plan (what will be attached and when)

- **Pre-purchase reports**: already completed for the identified pipeline.
- **Post-vend-in reports**: refreshed NI 43-101 reports reflecting ownership changes and updated commodity pricing inputs (gold/silver and REE pricing dynamics).
- **Annex handling**: final NI 43-101 reports will be **annexes to the Supplemental PPM / PPM Supplement(s)** and integrated into later exchange/regulatory disclosure packages.

18.2. SEC REGULATION S-K 1300 (UNITED STATES)

1) What S-K 1300 is designed to do

SEC Regulation S-K 1300 is the U.S. disclosure framework governing **mining property disclosures** for SEC registrants. Its purpose is to standardize how mining companies describe:

- mineral resources and mineral reserves,
- property-level material information,
- the technical and economic assumptions supporting classification, and
- the credibility of the professionals responsible for the disclosures.

Where NI 43-101 anchors Canadian market expectations, S-K 1300 anchors **U.S. public market credibility** and is a foundational requirement for Terra's planned NASDAQ readiness.

2) Core concept: "modernized, investor-grade property disclosure"

S-K 1300 is intended to ensure that disclosed mineral reserves are economically viable and supported by appropriate studies and assumptions. It requires clarity about:

- what is known vs inferred,
- what assumptions are being made (prices, recoveries, costs, permitting), and
- the degree to which these assumptions are supported by evidence.

S-K 1300 is notably focused on preventing promotional-style disclosure by enforcing a disciplined reporting standard and requiring explicit statements about uncertainty and risk.

3) Qualified Person and responsibility structure

Under S-K 1300, disclosures are typically supported by qualified technical professionals. Terra's approach is to apply **QP-governed controls** similar to the NI 43-101 discipline, with the QP overseeing:

- technical inputs and estimation assumptions,
- classification rationale,
- documentation of evidence and methods, and
- integrity of property-level disclosures that may ultimately be used in U.S. filings.

Terra's internal governance should treat S-K 1300 as a **disclosure control system** that requires:

- repeatable evidence pack generation,
- version-controlled assumptions,
- and formal sign-off processes.

4) Resource and reserve classification logic (high-level, Terra relevant)

S-K 1300 distinguishes resources from reserves and expects that:

- **Mineral Resources** reflect reasonable prospects for eventual economic extraction, based on geological evidence and appropriate assumptions.

- **Mineral Reserves** reflect economically viable extraction supported by a credible plan (including modifying factors).

The key point for Terra's plan: S-K 1300 requires that reserve statements be grounded in **economic viability** and appropriate study support, with transparent assumptions.

5) Property-level disclosures and "materiality discipline"

S-K 1300 is property-oriented. For material properties, the disclosure regime expects registrants to provide information that helps investors understand:

- where the property is and why it matters,
- the nature of the mineralization and project status,
- what technical work has been done, and
- what risks and constraints exist (permitting, infrastructure, metallurgy, etc.).

Terra's business plan should explicitly state that:

- the S-K 1300 reporting is used to support NASDAQ readiness, and
- disclosures are produced under disciplined evidence management so that property statements remain consistent as assumptions update.

6) Study support and "modifying factors" expectation

Reserve disclosures generally depend on modifying factors such as:

- mining methods, dilution, recovery, and scheduling assumptions,
- metallurgical processing pathways and recoveries,
- infrastructure feasibility, and
- environmental/permitting and legal constraints.

Terra's approach should be to:

- treat study support as a staged maturity pathway (certify-first, then industrialize after financing), and
- explicitly update S-K 1300 reporting post-vend-in to reflect ownership changes and updated price decks (gold/silver + REE pricing changes).

7) How Terra uses S-K 1300 strategically

Terra uses S-K 1300 in three principal ways:

1. **NASDAQ readiness narrative**: establish early that the program is engineered to meet U.S. disclosure expectations.
2. **Government and lender diligence alignment**: the discipline of S-K 1300 (materiality, assumptions, evidence) supports DOE-grade diligence readiness.
3. **Consistency and auditability**: maintain consistent property narratives across investor materials, supplements, and later public filings by anchoring to a controlled technical reporting workflow.

8) Terra-specific annex plan (what will be attached and when)

- **Pre-purchase S-K 1300 work**: already completed for the identified pipeline (as stated in your program design).
- **Post-vend-in updates**: refreshed reports reflecting ownership changes and updated commodity price assumptions.
- **Annex handling**: S-K 1300 technical reports will be delivered as **annexes to the Supplemental PPM / PPM Supplement(s)** and then used as the authoritative backbone for future U.S. listing disclosures.

18.3. TERRA TECHNICAL REPORT ANNEX APPROACH

- Pre-purchase technical reports: completed on the identified pipeline to support the US$100B reserve framework.
- Post-vend-in updates: refreshed reports reflecting ownership changes and updated commodity pricing inputs.
- Annex handling: NI 43-101 and S-K 1300 technical reports to be annexed to the Supplemental PPM / PPM Supplement(s).
- JORC: Not committed as an annex framework for this plan because Australian listing is not the initial pathway.

19. APPENDIX C — MIDAS LIFECYCLE (ASSESSMENT → CERTIFICATION → MINING → REFINING → DISTRIBUTION → CUSTOMER HANDOVER)

MiDAS functions as Terra's mineral data backbone and oracle layer. It integrates Alchemy EcoMiners and third-party geophysics/drone/satellite/LiDAR inputs, manages evidence lineage, supports technical reporting assembly, and records chain-of-custody events through operations and delivery.

19.1. DATA INPUTS AND INTEGRATION

- Historical datasets: prior drilling, assays, geological models, sampling records, prior technical reports.
- New acquisition: ground scanning, 3D spatial mapping, geophysics, drone/satellite imagery, LiDAR, and other third-party datasets.
- Governance: source attribution, timestamping, integrity checks, and QP review checkpoints.

19.2. WORKFLOW STAGES

- Assessment intake: ingest and normalize asset data; confirm chain-of-title and project metadata.
- Evidence build: integrate scanning/mapping and third-party data; establish QA/QC and model lineage.
- QP certification workflow: resource/reserve estimation governance, modifying factor documentation, sign-off trail.
- Technical report assembly: generate annex-ready NI 43-101 and S-K 1300 evidence packs (subject to counsel and disclosure controls).
- Operational telemetry: record mine planning milestones, production lots, refining batches, inventory movements.
- Custody events: vaulting/custody transitions, transport events, inspection events, delivery acceptance events.
- Customer handover: delivery confirmation, provenance bundle, and (where applicable) customer-facing allocation instruments.

19.3. TOKENIZATION ENABLEMENT (STAGED)

- Tokenization is implemented after ground scanning and 3D spatial mapping and QP certification are completed.
- Allocation instruments reference evidence-backed production lots/batches and custody events recorded in MiDAS.
- Objective: strengthen provenance, reduce dispute risk, and support institutional-grade auditability.

20. APPENDIX D — GOVERNANCE SUMMARY

20.1. BOARD COMPOSITION

- Board size: 5 directors.
- Company nominees (2): Peter Banks (CEO); David Roland Crouch II (CIO & Interim CFO).
- Independent directors (3): to be appointed; under confidential negotiations with target profiles spanning defense/defense contractors, former government officials, critical minerals experts, manufacturers utilizing critical minerals, and mining/mine operations leaders.
- Controlling shareholder: The Aureus Company expected to retain ~75% post-transaction (subject to final cap table).

20.2. GOVERNANCE CONTROLS

- Disclosure controls: version control of technical reports, assumptions, and release mechanisms (including PPM supplements for offering disclosures).
- Operator oversight: contract KPIs, reporting cadence, safety and compliance requirements, and MiDAS integration obligations.
- Risk management: staged execution; certify-first gating prior to deploying major development capital.
- Audit readiness: selection of audit firm (to be appointed) and establishment of control environment suitable for public company obligations.

21. APPENDIX E — STAKEHOLDER ENGAGEMENT SUMMARY (DOE/DOD/MANUFACTURERS/INVESTORS)

21.1. E1. STAKEHOLDER MAP AND MESSAGING

Stakeholder	Primary Objective	Core Proof Points	Primary Artifacts
DOE	Integrated mine-refine-supply development and financing	Certification discipline; operator model; IDC + Year 5 revenue sweep policy; supply waterfall	DOE readiness pack; technical annexes; contracting/offtake framework
DoD / Defense Contractors	Secure supply, quality, continuity	Traceability; custody controls; verified reserves; delivery governance	Supply MOUs/offtakes; provenance bundles; QA/acceptance protocols
Manufacturers / Industrial	Continuity of supply and provenance	Allocation instruments; chain-of-custody; predictable throughput planning	Framework agreements; delivery schedules; provenance docs
Investors / Public Markets	Disclosure discipline and scalability	NI 43-101/S-K 1300 governance; public platform; operator partnership model; controlled expansion plan	Business plan; technical annexes; governance disclosures; public communications

21.2. ENGAGEMENT CADENCE (INITIAL)

- Investor relations/public communications supported by OrionIQ (communications coordination and message discipline; no broker-dealer activities).
- Government-facing engagement supported by diversified DOE advisory team and compliance-oriented documentation workflows.
- Technical engagement supported by QP governance and annex-ready reporting outputs.
